

CI / CD

Value To The Business

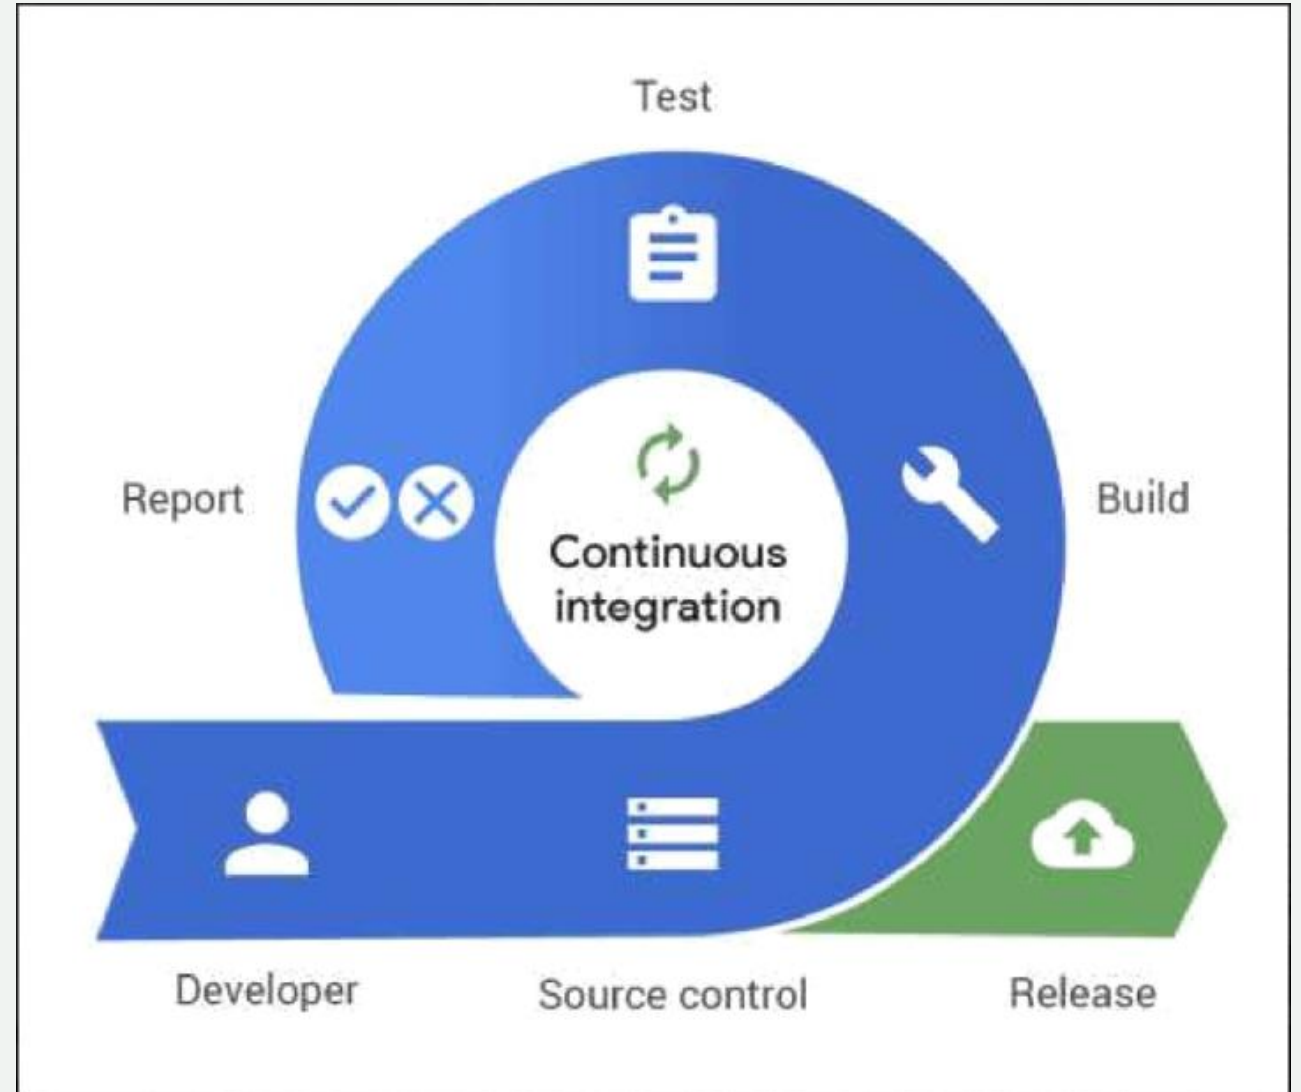

Salah Abogazya

Presentation Content

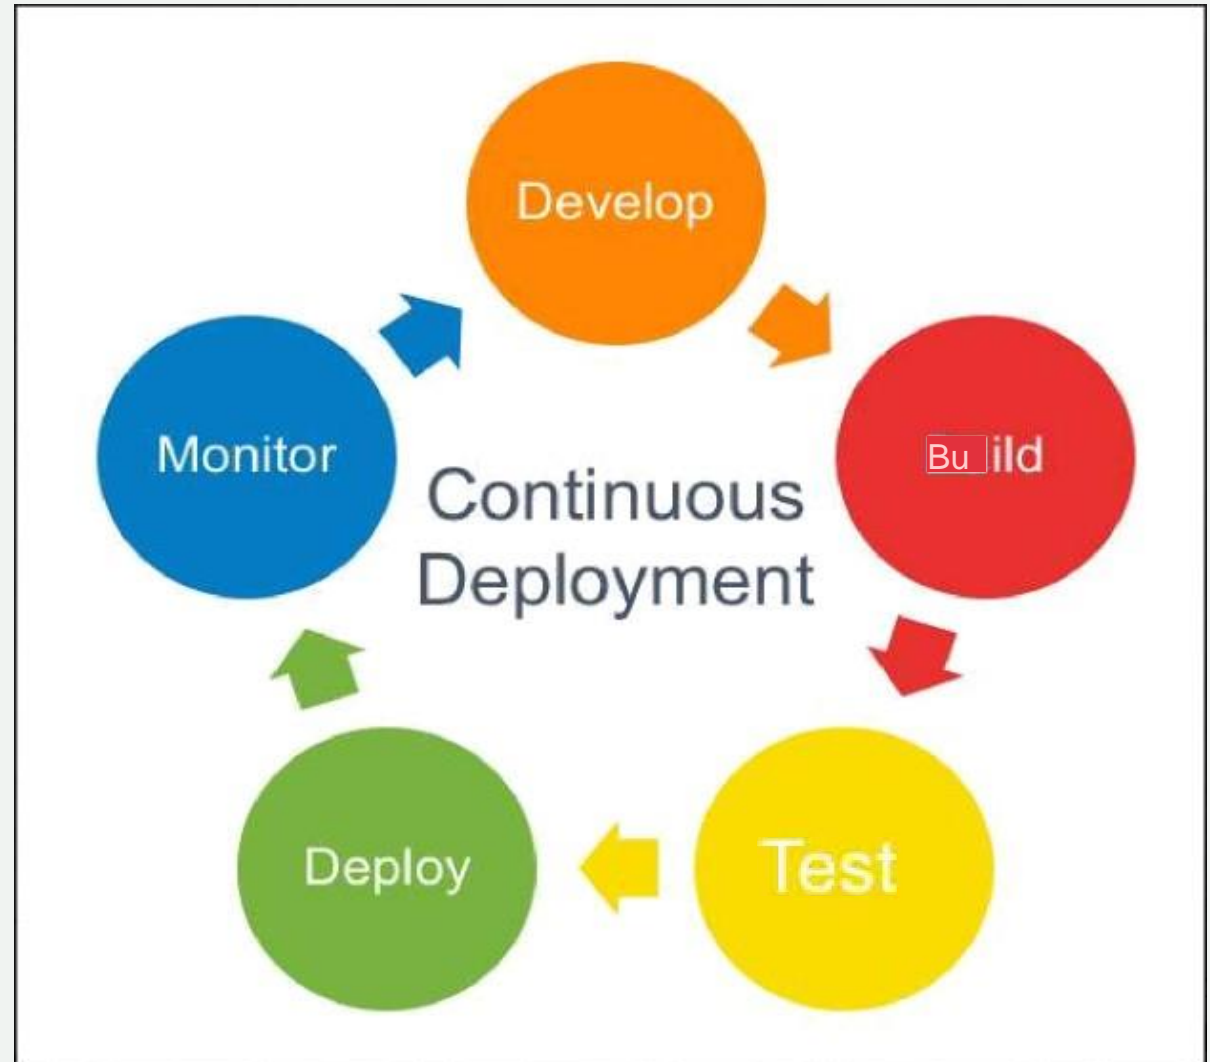

- **Continuous Integration “CI”:**

The practice of merging all developers' working copies to shared mainline several times a day. It's the process of "Making". Everything related to the code fits here, and it all culminates in the ultimate goal of CI: a high-quality, deployable artifact!

- **Continuous Deployment “CD”:**

A software engineering approach in which the value is delivered frequently through automated deployments. Everything related to deploying the artifact fits here. It's the process of "Moving" the artifact from the shelf to the spotlight

Benefits of CI/CD

- Automate Infrastructure Creation and clean up:
Eliminating human errors and avoid unnecessary cost of unused or invalid infrastructure

Faster to production:

By automating the pipeline to production this way, we can deploy features as soon as created which will help increase revenue

Automated Rollback Triggered by Job Failure:

Automate the process of rolling back and cleaning any infrastructure left which would help in reducing cost and lower down time

Catch Compile Errors After Merge:

Discover errors as soon as the developer make his commit which will help reduce the time of developers and reduce cost

Catch Unit Test Failures:

Unit tests are not neglected with CICD which will increase code quality and catch errors early before production which would decrease cost

Automated Smoke Tests:

Automate smoke test after deployment and automatic rollback in case of failure which will decrease downtime and reduce cost
